Ouch!

":TimberWolf 4.0.1 RC-2 on AmigaOS 4.1 Update 5.mpr4 could not be saved, because an unknown error occurred.

"Try saving to a different location."

This was an attempt to download with savefrom.net while in TimberWolf, which I was surprised to see trying to run the video itself! It would have taken hours at the rate it was going, though.

It did do the download, and I thought maybe it was working for a change, but now I know the crucial difference between "download" and "save."

Why does TimberWolf Download insist on starting names with a colon?
