I decided not to repair my SAM440EP, because that could render the motherboard completely death. I ordered today a ATI Radeon 9250 PCI and hope that it works.

What i did already:

- Changing UBoot-Prefs to PCI as Primary Output

What to do then when the PCI-Card arrives here?

- Comment out Radeon.chip in Kickstart-layout (Is it only for onboard M9 or what?)?
- Remobe Radeon-Monitor from DEVS:Monitor?
- Add PCI-Graphics to Devs:Monitors?

If thats not working i sadly have to bought a SAM460ex, maybe A-Cube can make a special offer, when sending my SAM440ep back?
