If you are offered an update, you might as well install it regardless of what the releasenotes say. In the case of pcgraphics.card, it had some Sam460 issues, so it hasn't technically changed for other platforms, but sometimes a very small bug might get fixed, but be overshadowed by a major bug. Its always worth installing the updates.

If your code delivery is anything like mine we only document the major changes. Otherwise our users find too may red herrings reading our release notes. We learned to only document the big changes.

Sometimes less IS more. 😊
