You can lock the windows in place side by side and the whole thing just looks like a more attractive version of Dopus4. I always used Magellan as a filemanager and not as a WB replacement like many others.

I couldn't agree more. Yes, it can replace OS 3.x but with WB improvements over time, it will more and more loose sense.

What I did loved with Magellan AS FILE MANAGER was ability to expand its features in ways Dopus4 couldn't and ability to customize itself completely. A real Amiga killer app.

Okay, vox and xenic, I have to admit I'm getting mildly interested in giving it another try, once the OS4 port gets ready.

Would it be an idea if one or both of you contributed settings files (possibly cut down examples) to make it easy for people to try out a working file manager style configuration without WB replacement?

Best regards,

Niels
