I was watching, waiting to see what happened once you tried the new version :)

I use WPA2-AES encryption, which requires upgrading the firmware on the card within Windows.

I'm assuming you didn't do that? WEP works fine without needing to flash the ROM?

The old 1.7 version is still there under prism2_sam.lha, which is a version I modified to remove some of the reset-handler code it had, which was freezing my system when I tried to reboot. The source isn't in the archive because I didn't expect the other one to be overwritten. At the moment I still have the original archive for 1.7 if someone needs it.
