Hey guys,

I recently reinstalled my Amigakit wifi card in my SAM and I'm seeing it wont stay online for more than 30 minutes or so. The network connection just dies, no crashes, etc... a quick reboot brings everything back... for another ~30 minutes.

Anyone seen such a thing, have any thoughts on where to look or have any possible solutions?

Here are a bunch of specifics: my SAM440ep is running the latest beta system. It doesn't seem to matter if the connection is active (open IRC, SSH shell session and pinging the router). I started with the v1.7 driver and I got the same thing when I switched to the v2.4 driver. My SAM is just a few inches from my base station (right now) and the network is "open" - no WEP/WPA. My card's BIOS has not been updated (weren't able to get the update software working).

Thoughts? Suggestions?

Thanks!

PJS
