Well this last test seems to ice it... To me it doesn't appear to be the OS.

I booted off a 2010 backup that predates my use of the wifi card. I first tried to run the v2.4 driver and WirelessManager, but that crashed. Then I tried my older v1.7 driver and that connected fine. I connected to IRC and starting pinging my router...

I had roughly the same results: After about 30 minutes my SAM lost its connection. This time I was letting DHCP do all the config, so maybe the previous luck with that was a fluke?

This time I was gone when it crashed and the pinging ran longer than before. I found that the failed pinging changed its message from "no buffer space available" to "Host is down" after a while. I guess that must reflect Roadshow figuring out something is wrong?

Again, anyone have any more ideas?

Thanks,

PJS
