URL:

"QT apps run in acceptable speed on arm devices at 600 mhz (the same power as pentium 2 500 mhz)."

They say Rasdberry pi @ 700Mhz has the CPU performance of 300MHz Pentium 2, so are you sure about "your" 600Mhz performance?

" Why so slow on sam 667 mhz that is in the same range of power if not more?  
"

As said, HW acceleration. And some ARM chips have a working L2 (SAM440ep 667Mhz does not). (btw. pi uses L2 only for GPU)

(also my 600Mhz cell phone has ok web speed, surely because GPU helps and the code is heavily optimized by mainstream SW developers)
