Curiouser and curiouser.

sofistissoftware is getting the results I would expect - a ~1Mhz increase in emulated CPU clock speed, and big gains for cache memory too.

davebraco and Elwood are getting speeds reported to be 10x slower.

So, what we need to figure out is, what's different between sofistissoftware's SAM, and davebraco/Elwood's.

These might help:

OS version + update status

Exact model/spec of SAM460

Additional hardware/non-standard software running at boot

Is it a SAM460 or an AmigaOne500 branded? Motherboard revision?

Anything else you can think of

Oh, and if you can re-run the OCM test again and see if you still get the same result, that'll be useful.
