Hmm, I think we're onto something here. Everybody who has reported the OCM version being 10x slower are OS4 betatesters, right?

The only people so far to have reported a speed increase are sofistisoftware and klapdeur, who aren't?

Looks like a bug or change in the OS4 beta is causing this problem.

Can we get some stats from the example program in the onchipmem.resource archive? If that is also running slow on beta systems then there's a problem with OS4 beta for sure.

@Elwood

I'm not sure I understood what you wanted us to test.

Running the updated program (with its DISABLEOCM tootype disabled as in the supplied icon) it is still slow. Clockrate at 2.91

How about with DISABLEOCM enabled? (it should be back to normal speed - but I want to make sure it's OCM usage causing the problem)

(btw, the crash is usually because it can't find the ROM, there's a bug in the previous release which causes it to crash instead of reporting errors)
