"can anyone tell me what kind of CPU socket XENA features?"

Xena is not socketed. She is soldered directly to the Nemo board.

She has no heatsink, no fan, and no need for either of them.

Access to her available pins are through the Xorro slot, using a board available from AmigaKit.

The primary processor on the Nemo board is a PA6-T.

It is not in a socket. This will make choosing a fan based on the socket used a bit tricky, at least.
