What kind of VGA do you have/use?

Loading without S-S (holding both mouse buttons or Help key) goes into the initial CLI/Shell?

Maybe one WBstartup command/programm (there is a hotkey ¿Left_Amiga? to bypass WBstartup IIRC) or just rename WBstartup drawer?

(CAREFULL WITH THIS ONE :-O)

Rename ENVARC:Sys to ENVARC:Sys2 and try to see if system boots and then one by one changing/saving/reseting prefes to see if systems still boots.
