You **never** need a complete partition for a software. Install it in a directory where you want.

I guess I wasn't so much thinking of it as "a software" but as some sort of separate system, full of its own software. It goes in a folder this time. Thanks.

AmiCygrix contains quite a few file links. If the links are not reproduced correctly then your AmiCygrix may not work the same or may not update properly in the future. I would reinstall it on your X1000.

Sounds like very good advice and I will take it. I'll probably try Chris' suggestion to copy my "AmiCygrix/Home/root" folder across, and see whether it works.
