Timberwolf is a very good browser with html5 support but without Gallium3d not very fast. We have to wait for Gallium3d 3D and then will Timberwolf fly

So if you ask me, its all unrealistic, and better collect 5k for fab. That for sure more realistic and more faster way to have html5 working in odyssey in os4.

Or, again, find out someone who will wrote html5 media player from scratch. If we still have anyone with free time and ability to do so (i doubt). For any real work from real coders, there should be some cash involved. With labor of love there only ports and all those simple apps can be done (with few exceptions, of course).

I know is not a lot in real world , but amigaos/mos/aros are not os for the real world

But ppls who spend their time to code something are real ppls and live in real world. Its not enough to just "love" something, real deals need it. If we will not pay our programmers via donations or via real deals, no one will do anything good for us in end of all.
