@Severin

Check plz todays build: xenic rewrote DopusRT5, as well as he found why it didn't works for us before : seems or you place it in system:c/ , or you have from old installation those "path add dopus5:c" string, while for me it was always in dopus5:c/ only, and all what i have in startup its only dopus5 assing just to make loadwb works when i in replacement mode. And because of that dopusrt wasn't found on our setups. Now it should works as 68k original. As well as no needs to have dopusrt5 in sys:c/ anymore, or any those patches to dopus5:c/. It will taken from dopus5:c/ directly.

As well as that nullpointer crash in configopus.module when native icons is used Xenic fix too (week ago or so). As well, as BSzili fix yesterday "clock" handling a bit more, so now titlebar issues almost fixed as well (only need to put that clock at the end of title bar now somehow, and it will be the same as in original, just without bugs).
