Upgraded Codebench 0.42 does not start

Hello everybody,

first of all many many thanks for further developing this great peace of software! I relly like to use it!

Unfortunately upgrading my previous Codebench version (latest one available previously before) did not work at all. After finishing the upgrade, soft reboot and trying to start Codebench it opens its own screen (as I set in previous version) but immediatelly claims an error telling me: "Failed to load the ClickTab close image." and only abort is presented. After pressing it two grim reapers occurs which can be ignored but Codebench does not start at all.

Posted below a snoopy excerpt which I captured until the "Failed..." message. I can't make head or tail of it!

I'm using a Peg2 with latest AOS4 beta (all updates provided by AmiUpdate have been installed).

Can somebody please tell me how to get Codebench0.42 up and running again?

Many thanks in advance and

Best Regards
