Installed new version from scratch, and:

```
-- pretty well done installer script.  
-- deficons tutorial done pretty nice too  
-- mason's icons looks pretty good as well  
-- after installation running of test-script do the deal and all works as expected.
```

So at moment while i do installation all going pretty professionally and well tested.

Then, do some real tests (i do not follow very well to what is need it for all those tests, just download and tried to run to see what will happens).

First try was [jtlnet](#)

After download do run as noted in readme and:

Quote:

```
ram:> jamiga:jamvm -jar jtlnet-withall.jar  
Could't fine Main-Class attribute in jtlnet-withall.jar Manifest.
```

Next one was [java telnet application](#)

Download and run:

Quote:

```
ram:> jamiga:jamvm -jar jta25b.jar  
jave.lang.ClassNotFoundException: de/mud/jta/Main  
at jave.lang.VMClass.forName(Native Method)  
at jave.lang.Class.forName(Class.jave:233)
```

Another try was [Java telnet daemon](#)

Download, unapck, and there can't found any .jar files, one .jave ones, and only in src directory, so dunno how to run all of those.

Another one was [Telnet Ninja](#)

Download and run:

Quote:

```
ram:> jamiga:jamvm -jar telnetninja-2.0.jar  
Could't fine Main-Class attribute in telnetninja-2.0.jar Manifest.
```

Is there anything you can recommend yourself to try and which should works ?

Anyway, even if i have no luck to run any random java telnet app from SF, good moment is that there is wasn't any single crash or DSI while i play with all of this.
