Maybe there just some different option, not -classpath, and not -cp, but something else ? As well as why it didn't works after i unpack it and run directly ? It all seems like something wrong with amiga native patches. I.e. all those adding of :/ and :/. imho make problems, dunno ..

Yes, there are evidently problems with amiga paths.

Perhaps you could try to give an absolute path. Something like:

Quote:

```
jamiga:jamvm -cp ram:jtelnet.jar
```

Also, there seems to be an issue with using the drive as root, given the slash that gets added: "ram:/jtelnet.jar".

Perhaps just put the jar in a drawer in ram:?

And that awful dot! Thought I had that fixed...

Quote:

Is there any reasons, why someone didn't include Manifest files by default ?

Might be that there is no main method to be run? I.e. the jar file should really be used as a library? Or there's simply several possible main methods.

I'll try to have a look at this tonight, had no amiga time yesterday.
