As it's a very very early work-in-progress versions, all you can really do with it is "play" with it. That means writing small Java programs yourself... or if you are REALLY lucky, you might manage to get a Shell-only Java program to work (i.e. one which doesn't have a GUI).

I wonder if [Apache Tomcat](#) would work. It's a webserver, so it should be console only.

There's a good chance that it has other dependencies, but it would be pretty neat if it did work; it's a sizable Java app.
