By default, in standard mode it works like that.

You mean in standard mode there no auto-save happens ?

Quote:

It's just not the same for singlepicture mode (no tooltype allowed in CLI mode)

If it only auto-saves when it in singlepicture mode, then maybe adding of option/parameter like "no_auto_save" will help ?

Quote:

I like it like that, period !

:) if you like it like this, then sure just keep it like this. Just for me it was a bit strange that when i start browsing my images, and all my images by some reasons was borked when i just rotate them for fun :) Not big deal anyway, users always can choice to not rotate at all.
