@kas1e

I meant that in standard mode (with main FastView window) by default the rotation occurs NOT on the original picture but on a new picture .ROTATE.

Except if you use ROTATE\_INPLACE Tooltype (it was the default on first version)

In SinglePicture mode it will be a pain (for me of course) to implement that.

And remember that rotation is not disruptive for your picture, if you make a mistake, you just have to rotate in other direction...

@Chris

"However it would be great if it inherited the datestamp of the original image."

Ah yes, I never noticed that you are right...but as I recreate a picture to make the rotation...

Chris, I sent you a mail yesterday evening, did you received it ?
