I've done it again... The RAM arrived, I put it in, and it didn't work well. I've read at many places that older Pega2 revs are fine with 2x512 MB, if I use the same exact brand, type, etc. Nevertheless I got the usual memory corruptuon problems, crashes, random transfer errors, graphic glitches. Mind you both modules work fine by themselves.
Now I'm left with a slightly corrupted SFS system partition, and 512 MB RAM. I might try SFSDoctor on MorphOS. I know OS4 and MOS SFS are not exactly compatible, but I have to reinstall OS4 anyway, so I have nothing to lose. I have two questions regarding my little venture:

1) Does anybody have a Pegasos II Rev 2B3 compatible 1024MB DDR module lying around? I don't have the money and fortitude to weed though all the 128x4 high density junk on the net 😕

2) What FS has the best revovery tools I could use for my system partition? FFS2?

edit: Meanwhile I tried SFSDoctor 1.1, and it fixed the block read error. Fortunately I used SFS\00 which seems to be compatible enough.
