Yes, I copied 'cancel#?' over from my X1000 installation and then I got an error about missing toolbars. I copied those over also and Codebench is working again. I'm sorry I have no idea what happened to those files; I've never directly handled anything that Codebench installed.

As far as system updates go, the last time the png_datatype was updated was back on 2013-6-18 and Codebench worked fine until very recently, at least up through AmiWest in October. The funny thing is AmiUpdate System Rollback shows the last date as 2013-9-29 and I know I've done quite a few updates since then.
