[JAmiga ENV variables]

CLASSPATH CURRDIR:,\$cptemp

Aha!

I believe that last \$cptemp might destroy things. Try and do this:

```
setenv SAVE CLASSPATH CURRDIR:,
```

The \$cptemp thing must have been added by my autoinstall, when an existing classpath env was empty... Or something like that. I'll try to fix that, so no-one else gets the same. But try the setenv, and I hope it'll fix things.
