I have finished the localization (in greek) for the newest version of OWB, but in the catalog description file there is a part which strongly mentions to convert the below strings in UTF-8 (for the context menus).

That sounds horribly non-standard. Catalog files are supposed to be in whichever 8-bit character set is specified in the header of the file. I'd be surprised if using UTF-8 for certain strings works at all, as locale.library may do some conversion of the strings when the catalog is loaded.
