Why do you insist on using message notification type when hook notification type gives more information?

Quote:

```
struct NotifyHookMsg
{
int32  nhm_Size;    /* Size of data structure */
int32  nhm_Action; /* What happened (see below) */
STRPTR nhm_Name;   /* The name of the object */
};
```

Also if you want consistent behavior between filesystems it's recommended to use ADO\_DOSMethodOnly that I mentioned before.
