While building 7.35.0 i think it make no sense, as if curl binary works fine for you , and its done from link lib which i use the same as for odyssey, then it's not libcurl.

And by "binary works fine" you mean it works with some options or how ?

Quote:

Tried under MOS3.0 / Odyssey 1.23 and it works by ignoring SSL errors.

But the same error even with latest crt from curl site when you didn't ignore ssl errors ? I.e. on our port then all the same, just "ignoring ssl errors" didn't works for you ?

Still will help really if you will find somewhere in the internet the same problem, and i can just compare everything myself, etc.
