URL:

@Fab

It works, but i had to write me a script for YAM

```
/* OdysseyURL.rx */
```

```
PARSE ARG URL
```

```
IF LASTPOS("ODYSSEY", SHOW(PORTS)) > 0 THEN DO
```

```
  ADDRESS ODYSSEY.1
```

```
  SHOW
```

```
  OPEN NAME URL NEWPAGE
```

```
  EXIT 0
```

```
END
```

```
ADDRESS COMMAND "WBRun APPDIR:ODYSSEY"
```

```
ADDRESS COMMAND "Wait 1"
```

```
DO FOREVER
```

```
  IF LASTPOS("ODYSSEY", SHOW(PORTS)) > 0 THEN DO
```

```
    ADDRESS ODYSSEY.1
```

```
    SHOW
```

```
    OPEN NAME URL
```

```
    EXIT 0
```

```
  END
```

```
END
```

It also deals with Odyssey not yet running

The only thing that really bugs me is that i need a "wait" before i can actually send the url...if i leave the wait out, Odysseys "port" will be found, but Odyssey itself won't be ready to process it (the main startpage will come up instead).

Thanks for the hints, now i need to understand the inner workings of URLOpen to make it work again...eventually

edit: The script works with Wookie aswell (without the annoying second Odyssey getting opened if one instance *is* already open) ... nice 😊
