URL:

@Raziel

I see you already sort it, but just in case:

To open in current window:

Quote:

```
ram:> rx "address odyssey.1; OPEN NAME 'http://google.com'"
```

To open in new tab:

Quote:

```
ram:> rx "address odyssey.1; OPEN NAME 'http://google.com' NEWPAGE"
```

Working script example:

Quote:

```
/**/  
Address Odyssey.1  
OPEN NAME "http://google.co.uk"  
Say "Done"
```

As for YAM and stuff, you can just install and setup OpenURL , it works fine together with os4's default URL, and i use it because of Arexx support, which sadly os4 devs do not want to implement to URL.

Quote:

and wait for URLOpen to get updated

If you mean Arexx support, then don't hold your hope: Colin says on hyperion's forum he will not add it.
