I use Cubic. Works fine for me. Some initial configuration is necessary, but once it's done, I found I like it.

Remember I got a note with it that aided the installation process. You should copy the CD contents to your harddrive: [http://amigaworld.net/modules/newbb/viewtopic.php?topic\\_id=28289&forum=32](http://amigaworld.net/modules/newbb/viewtopic.php?topic_id=28289&forum=32).

Have tried CodeBench on occasions, but the initial setup for compiling a simple project has always bored me. I don't understand the need to manually add all files individually, and having a separate header directory. What I'd really like to do is just to open a file, and by a key press make an existing makefile. Although I absolutely love the effort, and all the nifty features with SVN and community-thingie.

So, if you're beginning a new project, I'd consider CodeBench.
