I worked out the issue today, with some further help on why it happened from fellow Amiga user Sundown. Thanks as always for the help! 😊

The issue was the libz.so.1 file in SOBJS: wasn't there. On further investigation it seems that it and a couple of the files in this folder (eg. libz.so.1.2) are links, rather than real files. As a result, when I copied all the files from one hd to another when changing my hard disks, the links were not copied across with it.

I copied the links from the original AmigaOS4.1.5 CD as suggested by Sundown and problem solved. Qt and all the apps work properly again.

Thought it was worth closing the loop on how I fixed this issue in case anyone else comes across it in the future when transferring their AmigaOS4 system partition to another drive.

Catcha,
Epsilon
