@samo

check prefs:url and you will get it (there also was thread where i even post screenshots how to setup url prefs). url prefs have 5 tabs ; file, http, https, mailto and co. in every one you add what apps you want to be shown in that requester where you choice browser. for odyssey copy all as for owb in all five tabs just add it for odyssey name

and that all about urlopen. no need to worry about arexx. but if you need arexx then you use openurl. odyssey already can be used by both. all works automatically for you before because url come with configure for ib, owb and whatever.
