Tried here too a couple of MAILTO: links and OS4 Odyssey V1.23 doesn't do anything.

BTW can the UserScripts (javascripts) be used in such case, I mean redirecting MAILTO: links to URL/OpenURL/whatever_you_want?

Find that if you use Odyssey preferences 'Context menus' and you add

CATEGORY: Link

LABEL: MailTo (YAM)

ACTION: URLOpen %l

it works (sort of), you must click RMB to get context menu and shows a new entry "MailTo (YAM)" and in my case it opens YAM (as I configured so in URL prefs)
