There was big mistake from me in code : openurl didn't works at all before: i like a sucker forget to open openurl.library. Doh!

What works for us, its default inbuild urlopen (prefs:url), because it have no needs to open 3d party libs and way it handle apps not based on arexx, so, http/https/etc stuff just works as it, without needs to do anything else in code.

Mailto also should works, even if i forget to open openurl.library, if not that code:

...

just for the record - the os4 **urlopen** also does not work.

as others already mentioned running snoopy does not show any action when clicking on a mailto link.

regards...

michael
