Time for another fixes.

beta001:

<http://www.sendspace.com/file/uv1ymw>

What in:

1.

previously support of openurl.library was totaly broken and didn't works. We just was able to use inbuild for os4 urlopen for most of protocols, but not for mailto support. Also seems defaul inbuild to os4 urlopen can't open new tabs on already opened browsers (at least i tests joerg's owb, crhis's netsurf and odyssey).

So, i make openurl works as on morphos, as well as add fat-nice-gui error-warning window on running if you didn't have openurl.library installed.

After you will install openurl, you go to prefs:openurl, and in Mailers , do for example for simplemail that:

--definitions:

Name: SimpleMail

Path: Work:SimpleMail/SimpleMail

ARexx port: SIMPLEMAIL (big letters necessary)

--ARexx commands:

Show: SHOW

To Front: SCREENTOFront

Write mail: MAILWRITE MAILTO="%a" SUBJECT="%s"

Last line taken from simple mail guide, so, if you need YAM, then you refer to YAM guide.

2.

Registered with application.library, so to have all bonuses from later automatically

3.

Added ringhio support (yeah!), for all the downloads: done, fail and cancel.
