@All

Another beta:

<http://www.sendspace.com/file/4v7tjb>

New since last:

- rebuild with proper curl again, as by incident use too new one and that bring some ssl errors again. Now all fine (BillE and zzd10h, check if all ok plz).

- better deal with http's accept-language headers: added priority options as described in RFC, and make it works and depends on the priority in your prefs:locale (thank to Colin for tests and help and well as to Joerg). Even if you will have now 10 languages in priority settings, their priority in http header will be relevant to your your prefs:locale settings.

- update to latest codeset.library (6.18)

If all is ok, then that version will go to os4depot as next public fastfix, so plz test if nothing broken, etc.
