If you want it fixed, i need as much info as you can collect. I.e. do all that stuff which i note in previous post.

Did you have _any_ version now which works with it ? os4depot one, fastifix one, any ? beta4 or beta5 have differences ? In what _exactly_ fastfix it was corrected and is it still works in that fastifx, but stop working since some time ?

Did you set "ignore SSL errors" ?

Plz, answer on all questions step by step. Because as it now it sounds just like "it works in some in fastfixes, but not anymore". In what ones, when exactly, did you set ignore ssl errors options or not, etc,etc. Need answers on all questions or i can't help.
