Inlusive, all 1.23 versions upto now. I know the old version of spreedsheat worked but they updated it a while ago and then it stopped working, just ghosted.

EDIT: I got a message from a user who told me spreedsheat on google docs works with odyssey 1.23 and 1.24 on morphos. Just doubleclick on a cell and should bring up all colours. He uses spoof as safari but havent tried the rest. However on my x1000 none of the spoofing works with it.
