Is a multi-user filesystem a part of this project? Or is there some other system that this user system will sit on top of?

The description of the project (<http://openamiga.org/?function=viewproject&projectid=22>) mentions "file group settings" and "file permissions" as points to consider. The synopsis even specifies "involving file and process ownership". But note also that the synopsis starts with the word "Design", not "Implement" or "Create" like several other projects.

This may or may not be intentional, but it would make good sense to me that the most important step would be to have a common understanding of what needed to be done where (file systems, dos, kernel, env-handler, various tools and utilities, ...) before anything was actually implemented. And after that, if the design is approved, the implementation can be made by OS developers as well as external contributors, under some form of coordination.

But that's just my take, I don't know if that is actually the intention of OpenAmiga and/or the OS4 development team.

Best regards,

Niels
