I am one of the few Usenet hanger-ons to the sci.lang.japan group, which I access the only way I know how: through AmiCynix > Sylpheed.

Many of the posts include, or are in, Japanese, which comes out OK. But I hadn't been able to think of a way to post in that language. Then I had a thought: Use Gate2Home in AmiCynix > NetSurf, and copy the text over. Except typing in Gate2Home in the supposedly Japanese keyboard produces no Japanese.

Then I had another thought: I'd use the e-mail function of Gate2Home in Odyssey, where Japanese comes out just fine, e-mail the text to myself, read it via my e-mail account at gmail.hawaii.edu with AmiCynix's NetSurf, and copy the text over to sci.lang.japan.

Except trying to get gmail.hawaii.edu with that NetSurf gets me "SSL certificate problem / NetSurf failed to verify the details presented below. / Certificate chain." Beneath that, a light blue-filled rectangle, and accept and reject buttons. "Accept" gets me to an error message from the UH system. (<http://gmail.hawaii.edu> just brings up a log-in screen, so you can try it yourself.)

It might seem that this is an AmiCynix problem (and in fact I intend to copy this to that forum), but I cannot get my e-mail through the OS4 NetSurf either, with a difference: this one takes me straight to the UH ITS error message, nothing said about certificates.

Is there anything I can do to fix the AmiCynix NetSurf problem?
