Re: MPlayer LiveForIt V5.1

Author: : ggw

Date: : 2014/11/29 1:40:57

URL:

@LiveForIt

This sequence keeps presenting me with a requestor.

10.Work2:liveforit-mplayer> mplayer-altivec -playlist <http://media.kcrw.com/live/kcrwlive.pls>

----- the requestor -----

AmigaDOS

Please insert volume

http:

in any drive

Process: 960 "mplayer-altivec"

-----

If I Cancel the requestor, it reappears. Upon the 2nd Cancel, another appears. But when the 3rd one appears, then a Cancel allows the program to play as I had hoped.

My 5 questions:

1) Should I put this at the bugs list?

2) Is there a "how to use LiveForIt-MPlayer" that covers an error on my part?

3) Did I not get all of the documentation? The 2 README files mention documentation that is not in this directory.

4) Where should I be reading/asking about liveForIt-MPlayer?

and 5) I am used to typing Control+c to stop MPlayer, but now that hangs the program and window. Though I have discovered that opening a separate window and typing STATUS to find the <#>, then BREAK <#> ALL does cause a graceful exit, I have no way of knowing if this the accepted way or not? So. Is Control+c a feature request? Defect? or "Other"?

Thank you,

George Wyche

===== The computer setup =====

I am using X1000, most recent updates, downloaded liveforit-mplayer from OS4Depot last night. There is no installation so I put it directly into my Work2: an SFS-2 partition. My principle use of any mplayer is for internet audio streams.
