@Severin

I committed the OS4 Format changes which should be available in the next overnight compile. Please test the new OS4 format module. The Format changes only apply to OS4. The original Dopus5 format module should still work fine on a classic Amiga and I can't compile or test AROS & MOS versions.

The filter buffer problem turns out to be a much more difficult problem than I anticipated. The buffer sizes are hard-coded in a Dopus5 structure that is saved in the Environment config file. When I change the buffer sizes, Dopus5 doesn't load the config file correctly and I end up with a bizarre DOpus5 screen that doesn't work. The config file appears to be saved as a custom IFF file that I can't edit manually. Since I don't want Dopus5 users all over the world freaking out when their current config file or the default config file won't work, I'm not committing the filter buffer fixes until I can find a way around the config file issue. That might take quite a while, Sorry.
