I completed the code to fix your pattern issue and fontname size issue. However, the dopus5.org site is down and I'm waiting for it to be fixed so I can get a readout on the success of compiles for platforms other than OS4 & OS3. I'm currently looking at your "path resolution" issue. The only place I've found a problem with paths being resolved to a volume is "Environment/Path List." Is there anywhere else in the config where there is a path resolution is a problem?

@tekmage

I can't reproduce your reported "System crash when changing from action to icon action". I don't see any item called "action". I did test changing a XAD lister from "Name" mode to "Icon action" and I don't get a crash; just an empty lister which is to be expected. The XAD reader doesn't extract the files in an archive. It just reads the contents from the archive header and can't show icons that don't exist as files. Are you using the latest overnight compile from Dopus5.org? (From before it disappeared)
