Go into the "beta" drawer and download minimal or the full version. I use minimal. Then go to the "release" drawer and download libQtCore.so.4.7.0

Install the beta, then rename the libQtCore.so.4.7.0 to libQtCore.so and copy it over the old at qt:lib/. At least its how i did it and SMTube works and even can snapshot the gui position. It would not do it for me with the public version. Ofcourse rename your old setup if you want to go back.
