I fix one error for newer i386-aros compiler, but there is another ("U __INIT__symbol_set_handler_missing" on linking stage of library) which probably we can leave to aros devs (i made topic about on aros-exec, so there we can wait for aros devs).

Also today done with os3 crosscompiler and rebuild latest svn, so all beta-releases now on dopus5.org.

Through os3 build need to be tested as there can be some mess, but at least i fix libnix, libpools, add necessary includes/libs from our repo,etc. Probably all will be fine, but need to test in case i miss something.

edit: i386 build of aros fixed as well (commit 1070) with help of deadwood, so now dopus5 compiles for all platforms again.
