How to boot DOpus automatically

With OS4.1u6 I had set up DOpus5 in WB replacement mode some time ago.

When I upgraded to FE I decided to use Workbench, at least until I had a chance to fully appreciate it. But I discovered that if I put the DirectoryOpus icon on Workbench, I could click on it and get DOpus as an alternate screen, and the hot keys I had set up would work on Workbench as well. Hot dog!

So, until yesterday, I have been launching OS4.1FE and immediately clicking the DirectoryOpus icon. Then I thought maybe I could save myself a step by moving the icon into Prefs WBStartup. Bit it turns out that isn't the right thing to do, exactly. I now get alerts that DOpus is waiting to return, or DOpus is getting "tired of waiting" to return.

Of course, clicking the "Cancel" on those alerts is no easier than clicking the DirectoryOpus icon was, but isn't there after all some way to automate the procedure?
