If you get desperate, you should be able to use any regular Amiga floppy drive. The problem you will run into is the front bezel which is a bit different on the 3000T to most of the other Amigas.

With the memory side of things and going off my (bad) memory, you should at least have 2Mb of chip RAM on the motherboard. The 3000 and 3000T can take up to 16Mb of fast RAM on the motherboard as well but they require special DRAM chips to do so or you could just go a RAM board like a ZorRAM or something similar.
